

Crystallization Kinetics of a Solid Oxide Fuel Cell Seal Glass by Differential Thermal Analysis

Filesize: 5.36 MB

Reviews

A brand new eBook with a new standpoint. I have got read through and i also am confident that i will gonna read again once again down the road. Once you begin to read the book, it is extremely difficult to leave it before concluding.

CRYSTALLIZATION KINETICS OF A SOLID OXIDE FUEL CELL SEAL GLASS BY DIFFERENTIAL THERMAL ANALYSIS

BiblioGov. Paperback. Book Condition: New. This item is printed on demand. Paperback. 24 pages. Dimensions: 9.7in. x 7.4in. x 0.1in. Crystallization kinetics of a barium calcium aluminosilicate glass (BCAS), a sealant material for planar solid oxide fuel cells, have been investigated by differential thermal analysis (DTA). From variation of DTA peak maximum temperature with heating rate, the activation energy for glass crystallization was calculated to be 259 kJ/mol. Development of crystalline phases on thermal treatments of the glass at various temperatures has been followed by powder x-ray diffraction. Microstructure and chemical composition of the crystalline phases were investigated by scanning electron microscopy and energy dispersive spectroscopic (EDS) analysis. BaSiO₃ and hexacelsian (BaAl₂Si₂O₈) were the primary crystalline phases whereas monoclinic celsian (BaAl₂Si₂O₈) and (Ba(x), Ca(y))SiO₄ were also detected as minor phases. Needle-shaped BaSiO₃ crystals are formed first, followed by the formation of other phases at longer times of heat treatments. The glass does not fully crystallize even after long term heat treatments at 750 to 900 C. This item ships from La Vergne, TN. Paperback.
